Table S2. Clinical information of counselees in the additional analysis by center.

N (%) for count data for each participating data center

^g Extra-colonic cancers include those in the Revised Bethesda Guidelines

^w Includes individuals with colon cancers in different sites and cancers in multiple organs. Recurrences of the same cancer are not included.

^x Information about previous adenomas and/or colonic polyps was not available for all individuals.

^y All counselees who were MSI positive were germline tested.

Table S3. Combined c-statistic, observed to expected ratio, and positive and negative predictive value results across centers, with 95% bootstrap confidence intervals for the additional analysis

*#*PPV: Proportion of individuals with a probability or score above 5% who have a pathogenic homozygous or heterozygous LS variant; NPV: Proportion of individuals with a probability or score below 5% who do not have a pathogenic homozygous or heterozygous LS variant

*#*PPV: Proportion of individuals with a probability or score above 2.5% who have a pathogenic homozygous or heterozygous LS variant; NPV: Proportion of individuals with a probability or score below 2.5% who do not have a pathogenic homozygous or heterozygous LS variant

§Includes all counselees who had germline testing.

^aImprovement is defined as follows: higher c-statistic, O/E ratio closer to 1, higher PPV, higher NPV, and lower Brier score.

	C-Statistic	Observed to Expected Ratio	PPV †	PPV ‡	NPV †	NPV ‡	Brier Score

MMRpro(v2.1-6)>MMRpro(v2.1-5)	0.404	0.465	1	0.997	0.996	0.994	0.999
MMRpro (v2.1-6) > MMRpro+ (v2.1-5)	0.550	0.530	0.999	0.999	0.998	1	0.999
MMRpro+ (v2.1-6) > MMRpro (v2.1-5)	0.284	0.423	0.997	0.989	0.989	0.971	0.999
MMRpro+ (v2.1-6)>MMRpro+ (v2.1-5)	0.403	0.477	0.997	0.995	0.996	0.991	0.998
MMRpro (v2.1-5) > MMRpro+ (v2.1-5)	0.887	0.643	0.759	0.865	0.852	0.907	0.847

Table S4. Combined c-statistic, observed to expected ratio, and positive and negative predictive value results across centers, with 95% bootstrap confidence intervals comparing the MMRpro version 2.1-5 to the MMRpro version 2.1-6.

#PPV: Proportion of individuals with a probability or score above 5% who have a pathogenic homozygous or heterozygous LS variant; NPV: Proportion of individuals with a probability or score below 5% who do not have a pathogenic homozygous or heterozygous LS variant

#PPV: Proportion of individuals with a probability or score above 2.5% who have a pathogenic homozygous or heterozygous LS variant; NPV: Proportion of individuals with a probability or score below 2.5% who do not have a pathogenic homozygous or heterozygous LS variant

§Includes all counselees who had germline testing.

^aImprovement frequency is defined as the proportion of replicates for which model 1 had a higher c-statistic than model 2 across 1000 bootstrap replicates.

Model	NRI (MMRpro+)	NRI (PREMM ₅)	Log loss
MMRpro+			0.67 (0.55, 0.82)
PREMM ₅			0.52 (0.46, 0.58)
LR	-0.99 (-1.14, -0.84)	-0.21 (-0.42, -0.05)	0.42 (0.39, 0.45)
Spline	-0.84 (-1.00, -0.65)	0.21 (-0.18, 0.70)	0.47 (0.41, 0.56)
RF	-0.69 (-0.92, -0.47)	0.13 (-0.16, 0.34)	0.79 (0.51, 1.22)

Table S5. Net reclassification indices and log loss values for MMRpro+, PREMM₅, and several model combination techniques combining MMRpro+ and PREMM₅ on the data. All metrics are obtained through Monte Carlo cross-validation, with 100 iterations splitting the data into half for training and half for testing. LR refers to logistic regression, Spline refers to generalized additive model with multivariate smoothing splines, and RF refers to random forest. NRI (MMRpro+) refers to the net reclassification index when comparing to MMRpro+, and NRI (PREMM) refers to the net reclassification index when comparing to PREMM₅.

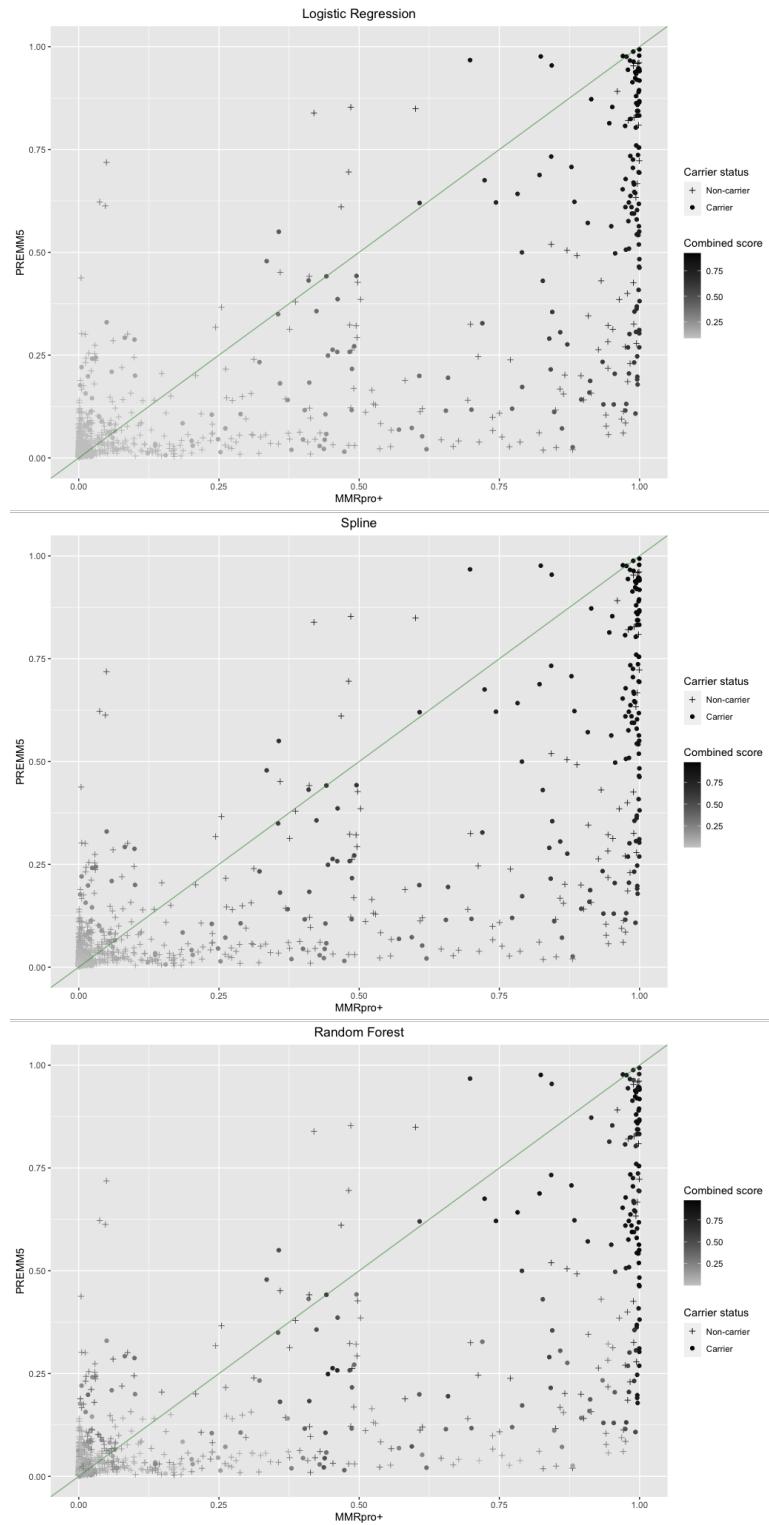

Figure S1. Plots comparing the MMRpro+ and PREMM₅ score. The dots represent individuals with a pathogenic homozygous or heterozygous LS variant, and the pluses represent individuals without a pathogenic homozygous or heterozygous LS variant. The points are shaded based on the scores for the combined models (logistic regression,

generalized additive models with multivariate smoothing splines, and random forests).
