R = Arginine

E = Glutamic Acid

D = Aspartic Acid

Underline = Somatic Mutation

K = Lysine

Highlight = Mutation Removed an Arginine

Supplementary Figure 1. Antibodies from C δ -CS B cells bind various antigens on HEp-2 cells with more intensity and frequency than antibodies from naive or IgG memory B cells. Micrographs of 63X magnification fields of the various C δ -CS (A), naive (B), and IgG memory (C) antibodies that bound HEp-2 slides as quantified in Figure 2A.

Supplementary Figure 2. The amino acid sequences of all clones reactive to DNA are compared from C δ -CS B cells. The sequences are sectioned into framework regions 1, 2 and 3 (FWR1, FWR2, and FWR3) and complementarity determining regions 1 and 2 (CDR1, and CDR2). The accumulation of charged amino acids (particularly arginine) is known to affect binding to DNA. Asterisks indicate a pair that is clonally related but has different mutations, and the color blue indicates the clones that were reverted to germline sequence for the experiments in Figure 5C. Underlined residues were introduced by mutation.
