

Supplemental Fig.1: Schematic outlining an ORF-based functional screen for kinases that drive resistance to B-RAF inhibition. The $BRAF^{V600E}$ cell line A375 was lentivirally transduced with the 597 kinases in the CCSB/Broad Institute Kinase ORF Collection. ORFs having a positive or negative effect on proliferation in control-treated A375 were identified and removed from final analysis. Resistance-promoting ORFs were identified by generating a differential viability ratio between B-RAF inhibited (PLX4720-treated) and control-treated cells. Differential viability was normalized to a constitutively active MEK1 allele, MEK1^{DD}; an assay specific positive control.

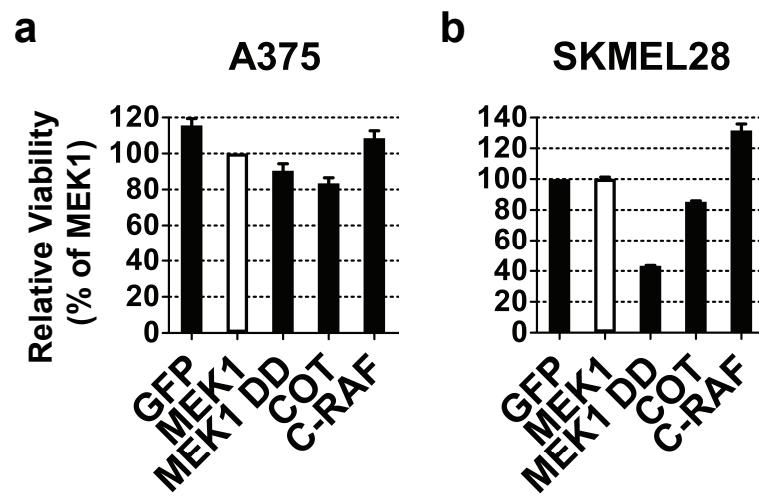

Supplementary Fig. 2: The CCSB/Broad Institute Kinase ORF Collection is well expressed via high titer lentivirus. (a), schematic of the pLX-BLAST-V5 lentiviral expression vector used for all ORF-screens and subsequent validation. (b), GFP-tagged ORFs representing a broad size range were lentivirally expressed in Jurkat cells and the percentage of GFP-expressing cells/ORF (e.g., infected cells) quantified, demonstrating high viral titer across a range of ORF sizes. (c), expression of 96 random ORFs detected via LiCor with antibodies against the V5-epitope tag, relative to cellular DNA. Expression was detectable in 83% of the wells.

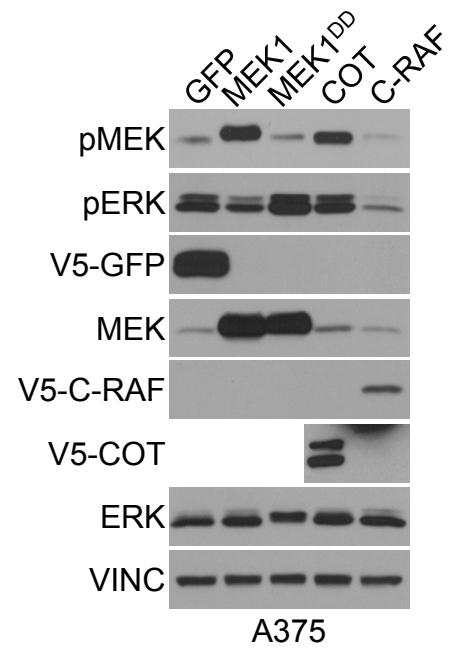

Supplementary Fig. 3: Expression of candidate resistance ORFs. 293T were transiently transfected with pLX-BLAST-V5-ORF (indicated) and expression detected using an anti-V5-HRP antibody. The AXL clone is ‘closed’ and has a stop codon preceding the V5 tag. See Supplementary Fig. 8 for verification of expression; (*) on dark-exposure indicate the expression of three ORFs not visible in the lighter exposure.

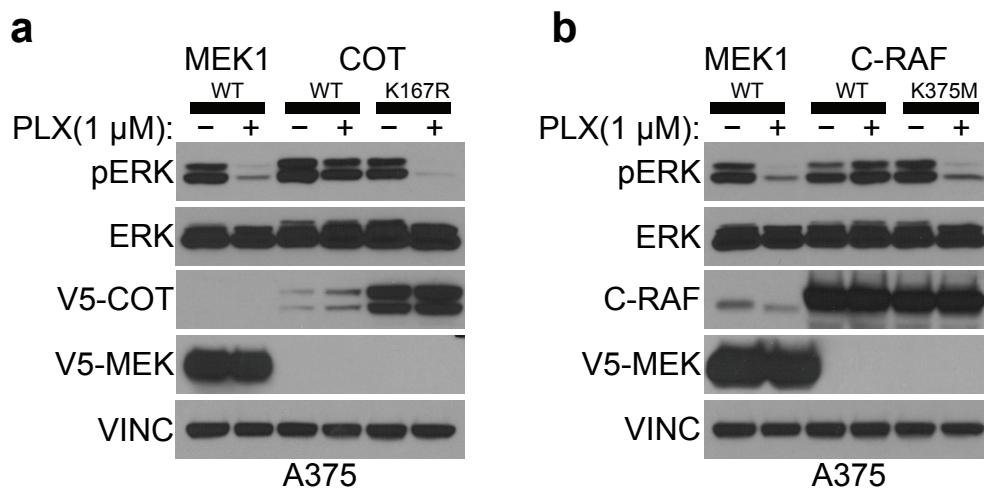

Supplementary Fig. 4: A secondary screen prioritizes the top 9 candidate B-RAF inhibitor resistance ORFs. The top nine ORFs scoring in the primary screen were expressed in A375 or SKMEL28 and a GI₅₀ generated from an 8-point PLX4720 concentration range.

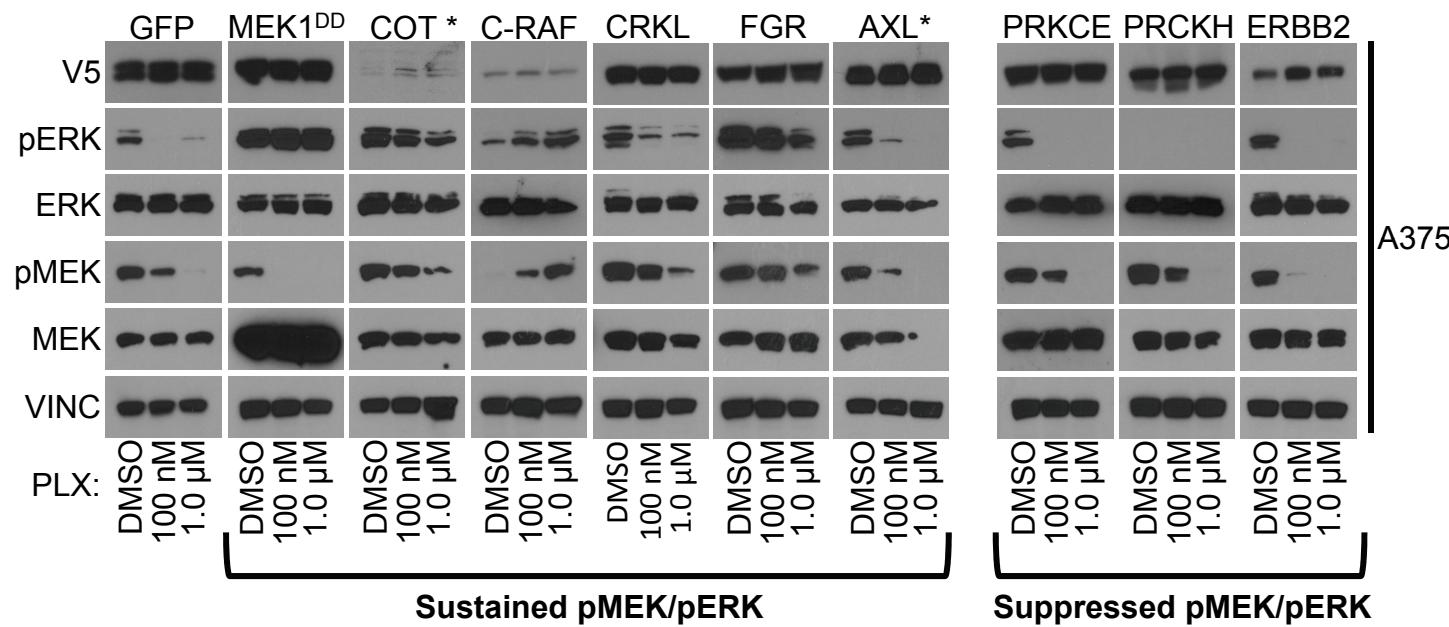

Supplementary Fig. 5: Effects of ORF expression on proliferation in B-RAF^{V600E} cell lines. Proliferation, relative to MEK1, in (a) A375 or (b) SKMEL28 expressing indicated ORFs after 7 days of growth.

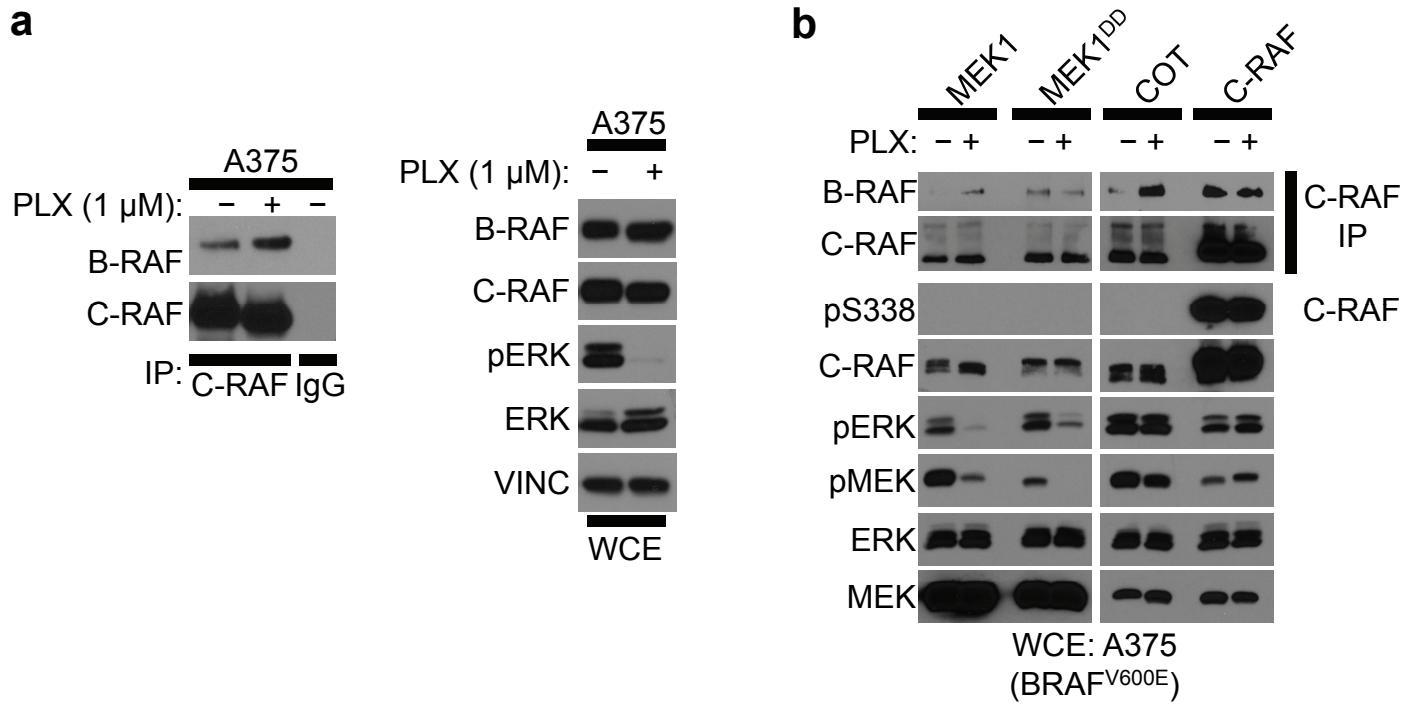

Supplementary Fig. 6: Ectopic expression of constitutively active MEK1 (MEK1^{DD}) and COT lead to increased pMEK/pERK in A375, whereas C-RAF reduces pMEK/pERK levels. Lysates from A375 ectopically expressing GFP, MEK1, MEK^{DD}, COT or C-RAF were analyzed via immunoblot for levels of pERK and pMEK. GFP and MEK1 (lanes 1-3) were separated from COT/C-RAF (lanes 4-5) to prevent residual V5-MEK1 signal from overwhelming that of COT and C-RAF, which are expressed at much lower levels.

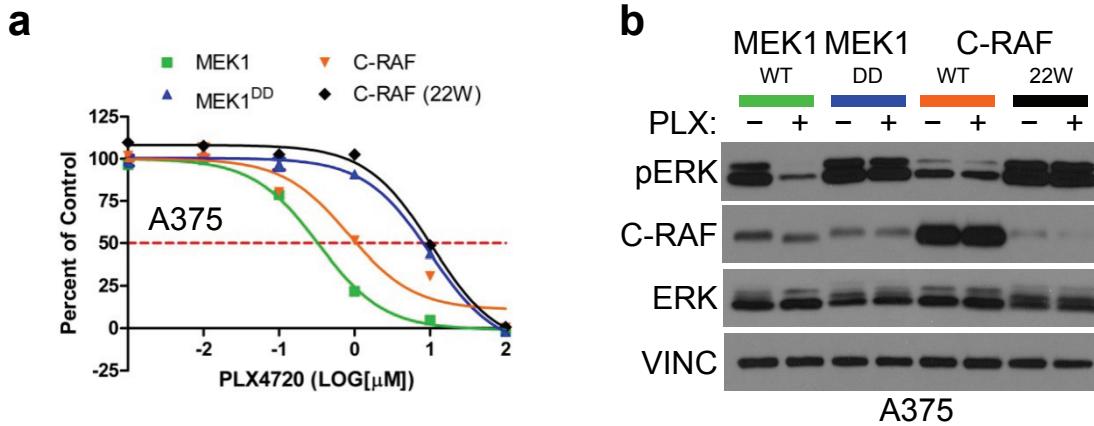

Supplementary Fig. 7: The kinase activity of COT and C-RAF is required for sustained ERK phosphorylation in the context of PLX4720 treatment. Immunoblot analysis of A375 expressing ectopic (a) MEK1, wild type COT or kinase inactive COT ($\text{COT}^{\text{K167R}}$) or (b) MEK1, wild type C-RAF or kinase inactive C-RAF ($\text{C-RAF}^{\text{K375M}}$) treated with 1 μ M PLX4720 for 18 h.

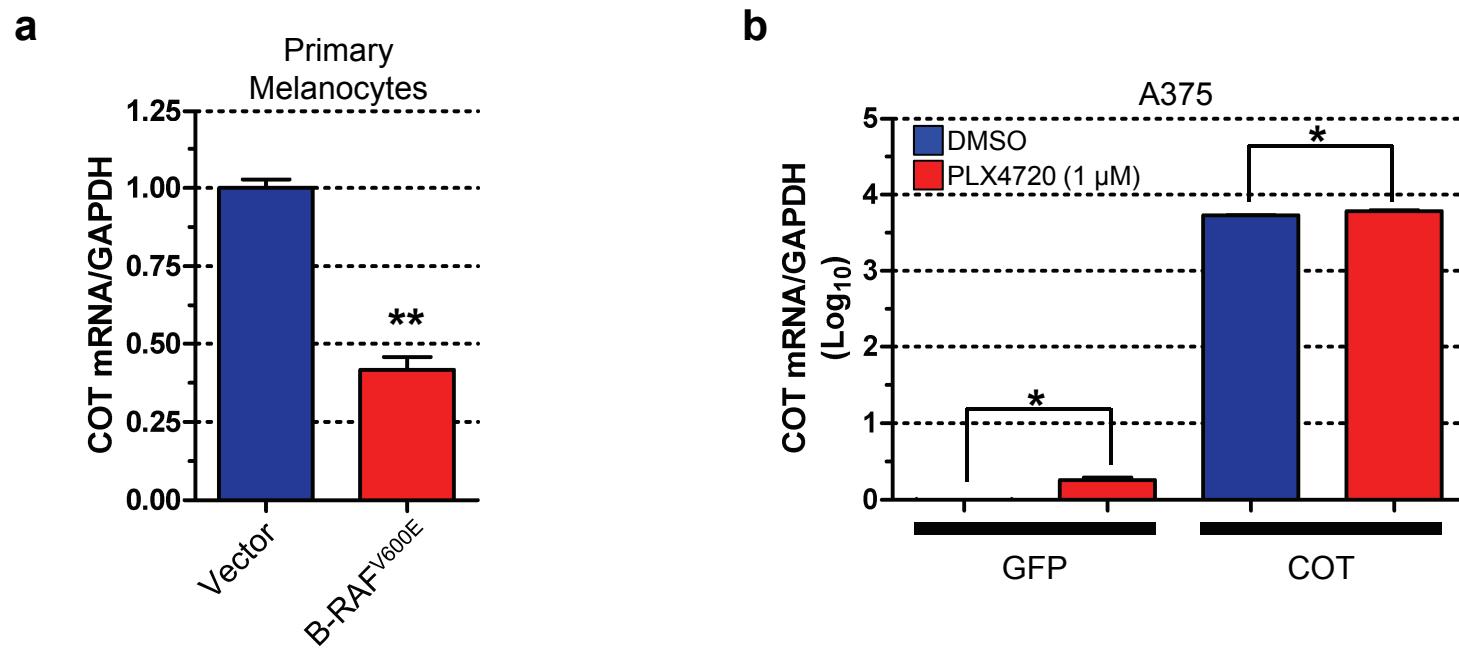

Supplementary Fig. 8: Effects of ORF expression on MAPK signaling in the context of the B-RAF inhibitor PLX4720. MAPK pathway activation was assessed by immunoblot analysis of pERK and pMEK in A375 expressing the indicated ORFs in the presence of PLX4720 (18 h., concentration indicated). (*) indicates the use of an antibody directed against the expressed ORF, not the V5 epitope. AXL was cloned without the V5 tag.

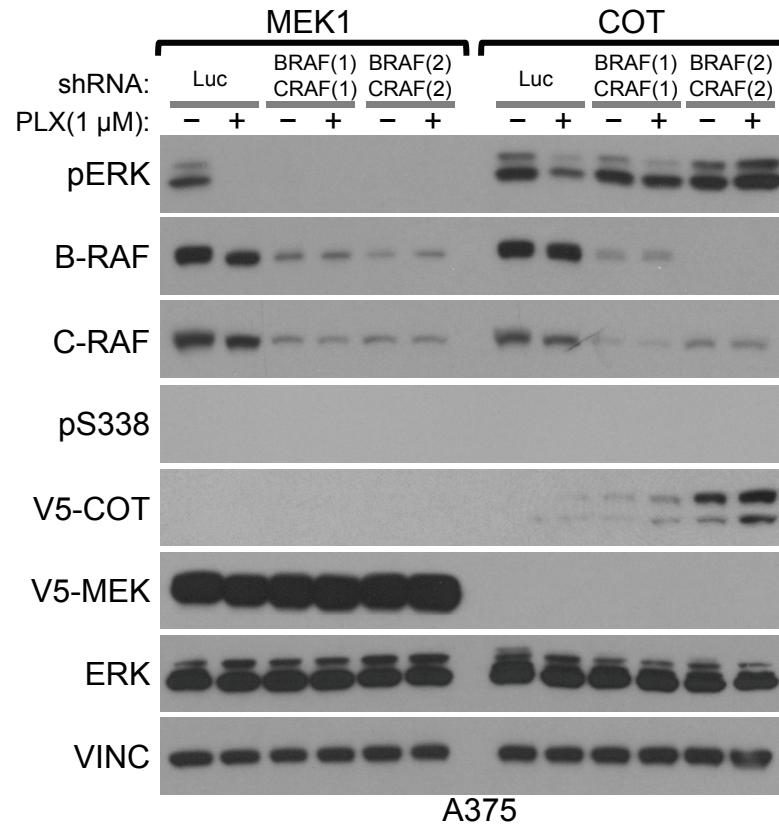

Supplementary Fig. 9: B-RAF associates with immunoprecipitated C-RAF in A375 following 18 hr. treatment with 1 μ M PLX4720 (+) or DMSO (-)(a). WCE; whole cell extract controls. Ectopically expressed C-RAF constitutively associates with B-RAF and is phosphorylated at S338, consistent with membrane localization and activation. MEK1, MEK^{DD} and COT-expressing A375 show no evidence of C-RAF activation, (b).

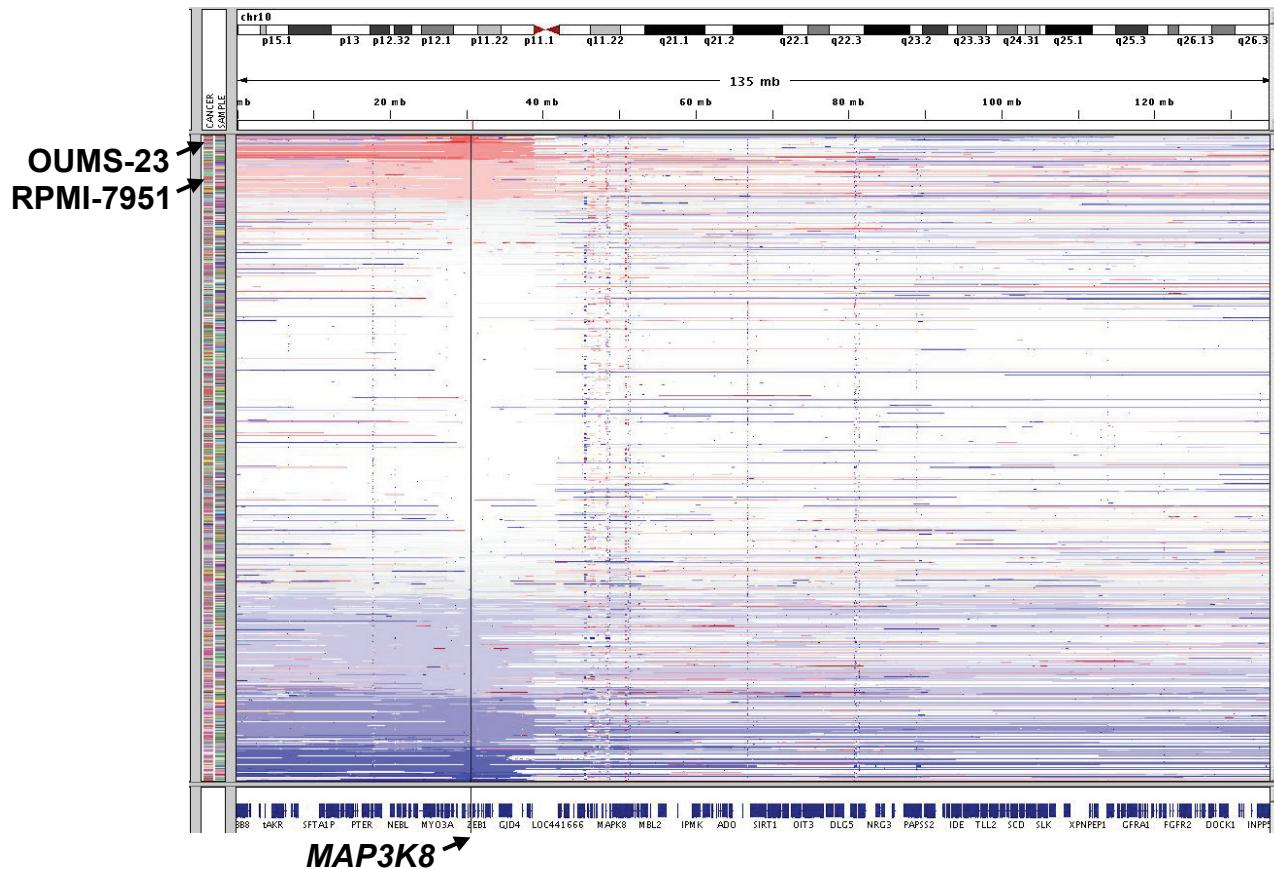

Supplementary Fig. 10: Retroviral expression of a wild-type C-RAF or a high-activity truncation mutant of C-RAF (C-RAF(22W)) renders A375 resistant to the B-RAF inhibitor PLX4720 (a) and leads to sustained pERK levels in the context of PLX4720 treatment (1 μ M, 18 h.), (b). C-RAF expression levels achieved with retroviruses are significantly lower than with lentiviral-based systems, resulting in a lower GI_{50} than that achieved with lentiviral C-RAF.

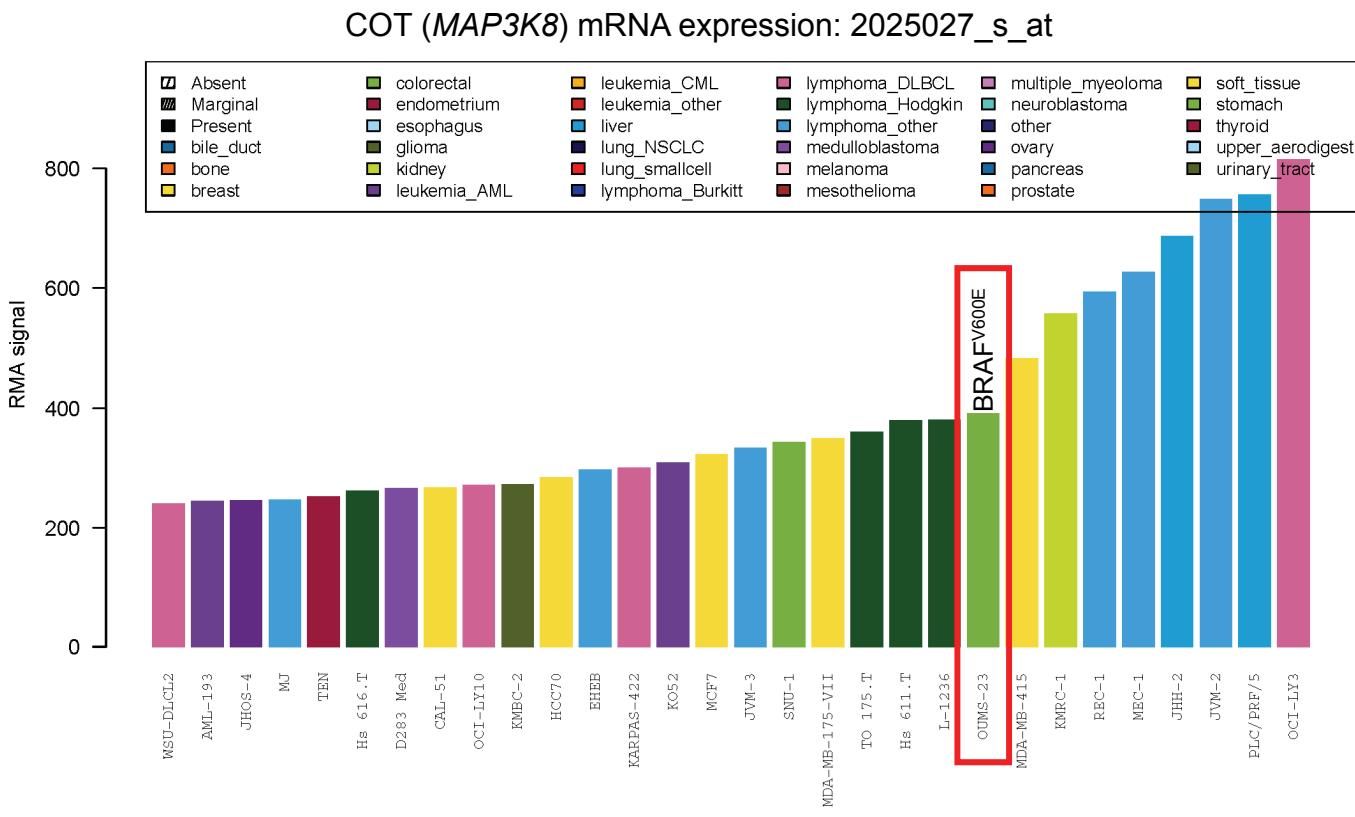

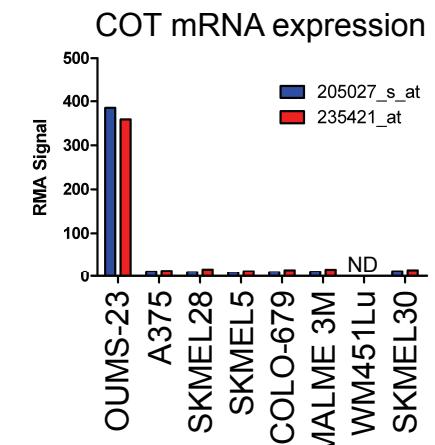

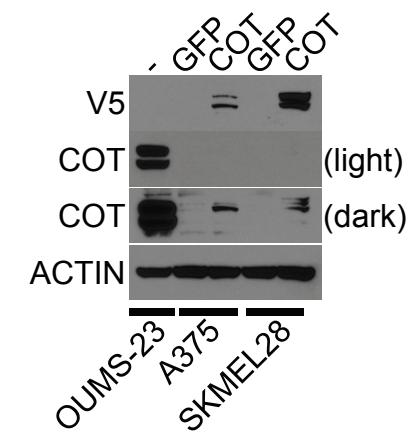

Supplementary Fig. 11: Effects of B-RAF^{V600E} on COT mRNA (a) Quantitative RT/PCR of COT mRNA expression relative to GAPDH mRNA expression in transformed primary melanocytes expressing wild-type B-RAF (vector) or B-RAF^{V600E}. COT expression was normalized to that of vector-expressing primary melanocytes. (**) Significant, $p < 0.05$ (Student's two-tailed, paired T-Test). (b) Endogenous COT mRNA is undetectable in PLX4720-sensitive A375 and ectopically expressed COT mRNA levels are unaffected by 1 μ M PLX4720 treatment. A375 expressing GFP or COT were treated for 18 h. with 1 μ M PLX4720. Reverse-transcribed mRNA was analyzed for GAPDH-normalized COT expression, relative to GFP-expressing, DMSO treated, A375. (*) Not significant, $p > 0.05$ (Student's two-tailed, paired T-Test). Error bars represent SEM.

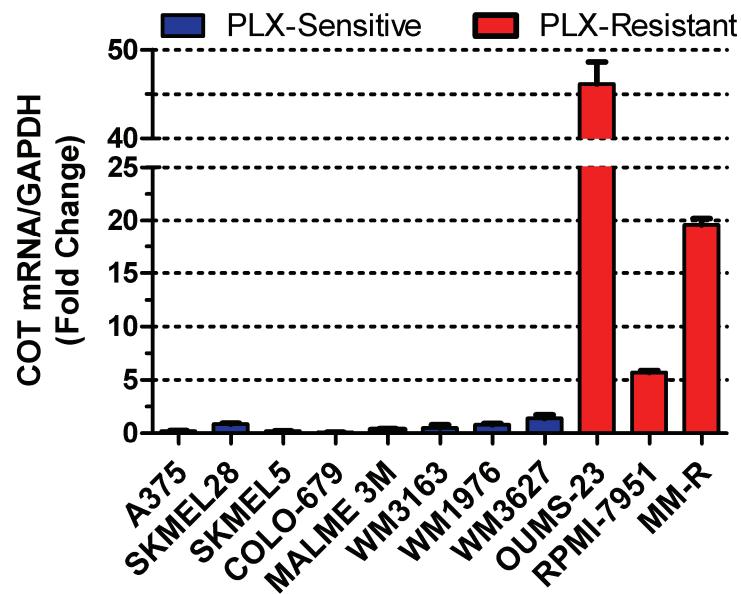

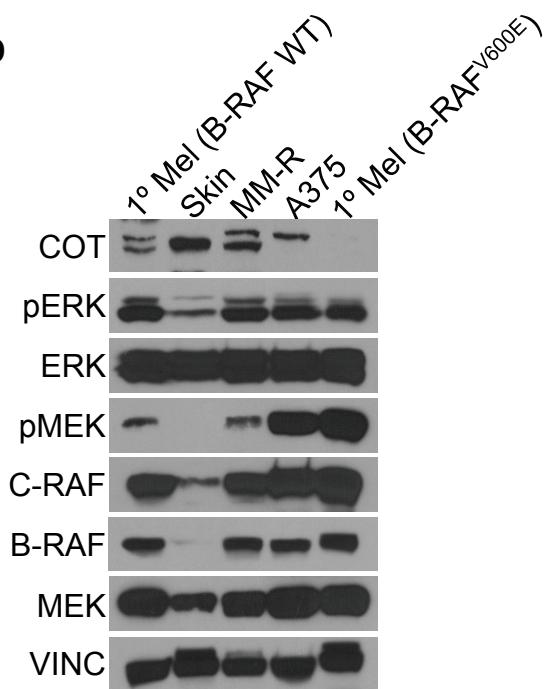

Supplementary Fig. 12: B- and C-RAF protein levels are not required for COT-mediated ERK phosphorylation. A375 expressing ectopic MEK1 (control) or COT were sequentially infected with lentivirus expressing shRNAs targeting B-RAF, C-RAF or control shRNA (shLuc) and assayed for expression of the indicated proteins in the presence (+) or absence (-) of 1 μ M PLX4720, 18 h.

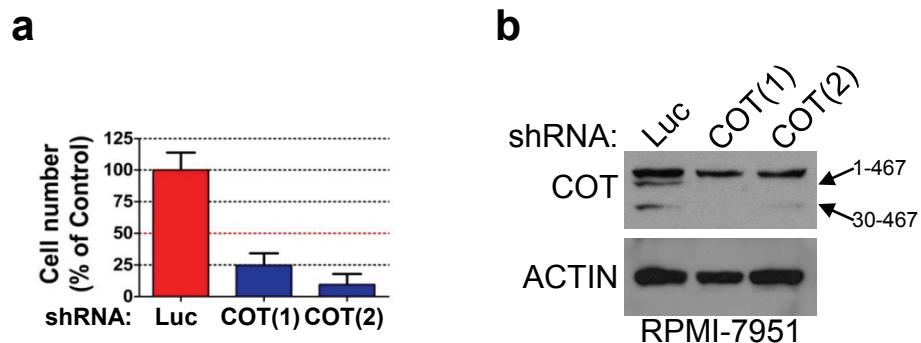

Supplementary Fig. 13: SNP analysis of 752 cell lines reveals copy number alterations in *MAP3K8/COT*. Of the 752 cell lines that had undergone copy number analysis, 534 had also undergone mutation profiling. Thirty-eight (7.1%) of mutation-profiled cells harbor the B-RAF^{V600E} mutation. Two cell lines (OUMS-23, RPMI-7951, indicated) harbor the B-RAF^{V600E} mutation along with copy number gain in *MAP3K8/COT*.

a**b****c**

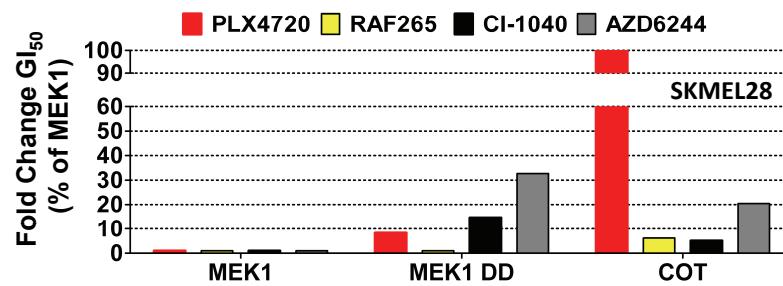

Supplementary Fig. 14: MAP3K8/COT alterations in the cancer cell line OUMS-23. (a) RMA signal of a *MAP3K8*/COT probe (noted) from mRNA microarray analysis. OUMS-23 is one of the top 2% (of 765 cell lines) expressing COT mRNA. (b) COT mRNA expression in a panel of B-RAF^{V600E}-mutant cell lines. (c) Endogenous COT protein expression in OUMS-23 relative to ectopically expressed COT in A375 and SKMEL28 cell lines, as determined via immunoblot analysis of the indicated cells.

a**b**

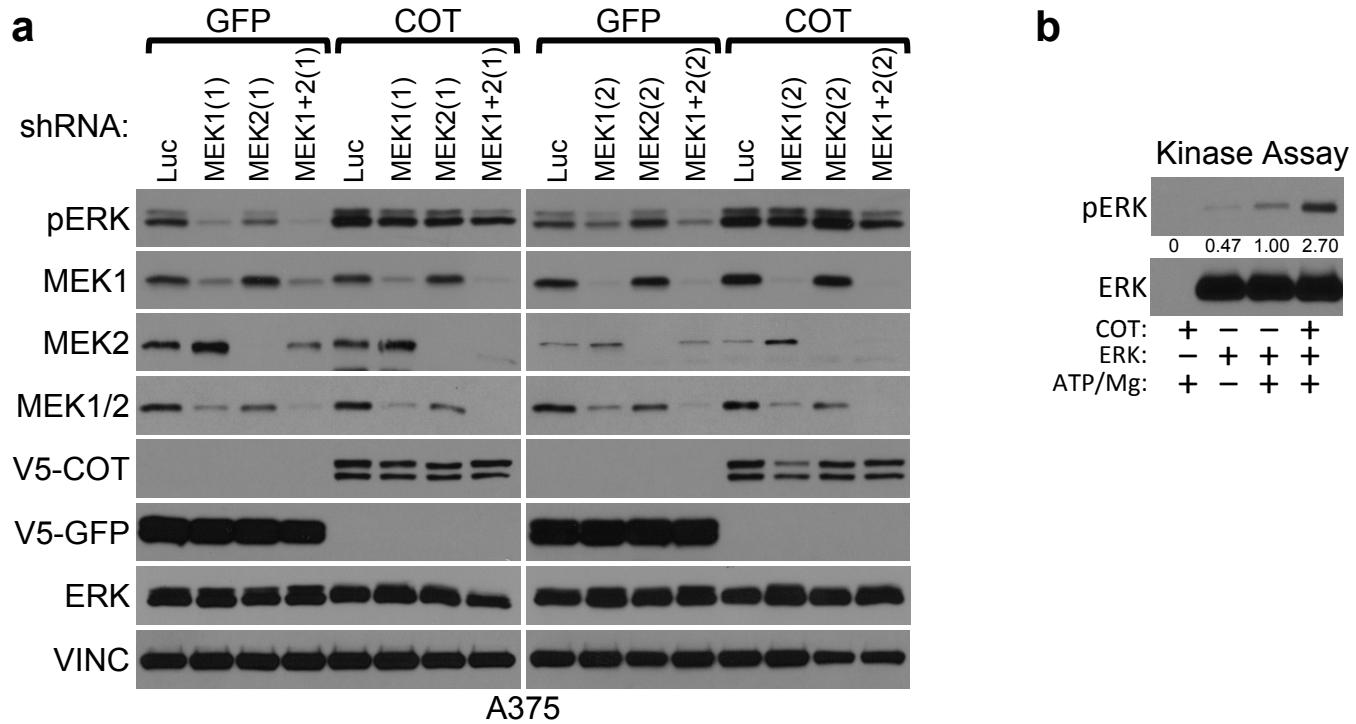

Supplementary Fig. 15: COT mRNA and protein are expressed in B-RAF-inhibitor resistant cell lines and tissue. (a) RT/PCR analysis of GAPDH-normalized COT mRNA expression in a panel of cell lines, short term cultures and tissue from relapsed, PLX4032-treated, malignant melanoma (MM-R). Corresponding protein expression for cell lines and short term cultures are shown in main Figure 3b and 3c, respectively. (b) Western blot analysis of lysates from primary melanocytes (1° Mel(B-RAF WT)), patient matched normal skin (Skin) and metastatic malignant melanoma (MM-R; COT mRNA shown in panel a), A375 cells and primary melanocytes expressing B-RAF^{V600E}(1° Mel (B-RAF^{V600E})).

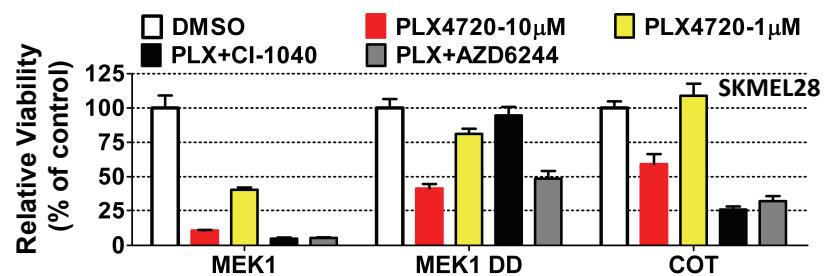

Supplementary Fig. 16: Depletion of COT affects viability in the COT amplified cell line RPMI-7951. (a) Quantification of RPMI-7951 viability following lentiviral shRNA-mediated COT depletion (shCOT), relative to control shRNA (shLuc). Error bars represent standard deviation between replicates. (b) Immunoblot analysis showing relative COT protein expression in shLuc and shCOT-expressing RPMI-7951.

Supplementary Fig. 17: Effects of ORF expression on the GI_{50} of a panel of MAPK pathway inhibitors in SKMEL28. The half-maximal growth-inhibitory concentration (GI_{50}) of SKMEL28 ectopically expressing MEK1, MEK1^{DD} or COT was determined for the RAF inhibitors PLX4720 and RAF265 and the MEK1/2 inhibitors CI-1040 and AZD6244. The change in GI_{50} for MEK1^{DD} and COT (relative to MEK1) was determined for each compound.

Supplementary Fig. 18: COT can activate ERK via MEK-independent and MEK-dependent mechanisms. (a) Immunoblot analysis of ERK phosphorylation in lysates from A375 following expression of GFP or COT and subsequent lentiviral shRNA-mediated MEK1, MEK2 or MEK1 and MEK2 (MEK1+2) depletion, relative to control shRNA (shLuc). Left and right panels represent two different pairs of MEK1 and MEK2 shRNA constructs. (b) Immunoblot blot analysis of recombinant, inactive ERK phosphorylation (Thr202/Tyr204) by recombinant COT in an *in vitro* kinase assay.

Supplementary Fig. 19: Combinatorial MAPK pathway inhibition effectively suppresses proliferation in SKMEL28. Viability (relative to DMSO) of SKMEL28 ectopically expressing MEK1, MEK1^{DD} or COT and treated with DMSO, PLX4720 (concentration indicated), PLX4720 (1 μM) and CI-1040 (1 μM) or PLX4720 (1 μM) and AZD6244 (1 μM). Error bars represent the standard deviation between replicates.
