

Names of genes whose expression values match PCA clusters

Multivariate analysis was used to identify the genes whose expression values were significantly different (FDR P <0.01) between group 1 (DBA/2 and 129Svlm), group 2 (A/J and SM) and group 3 (C57BL/6 and Balb/c) on day 3 and between the resistant (SM, C57BL/6 and Balb/c) and susceptible (DBA/2, 129Svlm, A/J) strains on day 7
