Table S2. Assessment of the multiple alignment quality

Multiple alignment	SP-score		
	NAFTT	PROBCONS	MUSCLE
ClustalW alignment (130 H1 sequences)	0.945	0.950	0.948
Curated alignment (130 H1 sequences)	0.951	0.956	0.954
Peptidase M13 (reference alignment)	0.879	0.885	0.882
SH2 (reference alignment)	0.895	0.902	0.741

The scores were calculated at <http://www.mtt.fi/AlignmentQuality/> as described by Ahola et al., 2008. The scores of two reference sequence alignments are shown for additional comparison.

Table S3. Nucleotide substitution models used for phylogenetic tree reconstruction

The best nucleotide substitution model for each alignment was calculated with jModelTest using maximum likelihood methods (Posada, 2008). I, proportion of invariable sites; α , gamma shape. The H1.1-H1.5 dataset includes the 130 sequences analyzed in this study. Phylogenetic trees were also reconstructed when the sequences were analyzed by partitions, taking into account the recombination breakpoints and when the sequences were analyzed by structural domains: N-terminal domain (NTD), globular domain (GD) and C-terminal domain (CTD).

Table S4. Frequency of indels in the 130 protein sequences of the H1.1-H1.5 subtypes

Subtype	H1.1						H1.2						H1.3						H1.4						H1.5

The indels were counted from the global H1.1-H1.5 alignment. Indels present only in paralog comparisons are referred to as paralog indels (PI). Indels present only in ortholog comparisons are referred to as ortholog indels (OI). All the indels were counted only once as explained in the Materials and Method section. The frequency was calculated as the total number of each type of indel present in each protein sequence divided by the number of residues. P-values were calculated with a Mann-Whitney U-test and correspond to the probability that the ortholog and paralog indel frequencies are the same for each subtype. **, very significant, *** extremely significant.

Table S5. Positive selection detection in mammalian H1.1-H1.5 gene-family using branch-site methods

PAML analyses were performed using a maximum likelihood phylogenetic tree (Figure 2). Branches labeled in Figure 3 were used as foreground branches. The branch-site model A (MA), allowing sites with $\omega > 1$ was compared with a null model that does not allowed for positive selection, using a likelihood ratio test (LRT). The proportion of sites in each category and the ω -values for the foreground branch are shown. BUSTED was used as implemented at datamonkey.org/busted using the paralog alignment. The model allowing positive selection (Sel) was compared with the Null model, using a LRT test. ^a in parenthesis the Bayes Empirical Bayes (BEB) posterior probabilities estimated by PAML or the p-values estimated by BUSTED are shown. PSS are reported in the selected branch (p-values < 0.001 in both analyses). Only those sites with a BEB posterior probability > 0.95 for PAML and a p-value < 0.05 for BUSTED are shown. In bold, sites that are confirmed by the two methods. The positions of the positively selected sites are referred to the multiple sequence alignment in Figure 1. N.A not allowed, as the null model was accepted. -, not calculated.

Considering the recombination breakpoints reported in the GARD analysis, the sequences were partitioned before running Codeml and a maximum likelihood phylogenetic tree was reconstructed for each partition with PhyML, using the best fitted nucleotide substitution model (Table S2). The model pairs compared in each partition were M0-M3; M1-M2 and M7-M8. InL, log likelihood; LRT, likelihood ratio test. In bold, p-values > 0.05, that allowed to accept the model with positive selection. Sites with posterior probability > 0.5 are listed; *, posterior probability > 0.9; **, posterior probability > 0.95. The positions of the positively selected sites are referred to the multiple sequence alignment in Figure 1. N.A., not allowed, as the null model was accepted.

Table S7. Analysis of variance (ANOVA) of the averaged omega ratios by domains.

The omega ratios per residue resultant of the accepted model from the pair M7-M8 were averaged by domains. The analysis of variance was performed at <http://vassarstats.net/>. The Tukey HSD test was performed to do a pairwise comparison of the means by domain

Table S8. Positive selection analysis with PAML site-models of the individual domains of mammalian H1.1-H1.5

The sequences were partitioned by structural domains before running Codeml and a maximum likelihood phylogenetic tree was reconstructed for each partition with PhyML, using the best fitted nucleotide substitution model (Table S2). The model pairs compared in each partition were M0-M3; M1-M2 and M7-M8. InL, log likelihood; LRT, likelihood ratio test. In bold, p-values > 0.05, that allowed to accept the model with positive selection. Sites with posterior probability >0.5 are listed; *, posterior probability > 0.9; **, posterior probability > 0.95. The positions of the positively selected sites are referred to the sequence alignment in Figure 1. N.A, not allowed, as the null model was accepted.

Table S9. Positive selection analysis of H1.1 partition 3 with REL and ADAPTSITE

REL				ADAPTSITE		
Position	Bayes factor	Posterior probability	Selection	Position	p-value	Selection

The positions are referred to the multiple sequence alignment in Figure 1. In red, basic residues. P, positive selection; N, negative selection.

Table S10. Percentages of the different amino acid types in H1.1

Species	Basic	Acid	Polar	Hydrophobic	Aromatic
<i>H. sapiens</i>	38.8	1.0	19.4	40.8	0.0
<i>M. mulata</i>	37.9	1.0	20.4	40.8	0.0
<i>P. troglodytes</i>	38.8	1.0	18.4	41.7	0.0
<i>T. syrichta</i>	35.2	0.9	18.5	45.4	0.0
<i>O. garnettii</i>	37.0	1.0	15.0	45.0	0.0
<i>P. anubis</i>	37.9	1.0	20.4	40.8	0.0
<i>C. sabaeus</i>	37.9	1.0	19.4	41.7	0.0
<i>C. atys</i>	38.2	1.0	21.6	39.2	0.0
<i>M. musculus</i>	39.2	1.0	15.7	44.1	0.0
<i>R. norvegicus</i>	38.8	1.0	16.5	43.7	0.0
<i>M. auratus</i>	39.2	1.0	15.7	44.1	0.0
<i>P. maniculatus</i>	39.2	1.0	13.7	46.1	0.0
<i>M. ochrogaster</i>	39.2	1.0	16.7	43.1	0.0
<i>N. galli</i>	39.2	1.0	13.7	46.1	0.0
<i>J. jaculus</i>	37.5	1.0	7.7	53.8	0.0
<i>B. taurus</i>	37.7	0.9	17.9	43.4	0.0
<i>C. ferus</i>	37.7	0.9	13.2	48.1	0.0
<i>B. bison</i>	37.7	0.9	17.9	43.4	0.0
<i>C. familiaris</i>	38.8	1.0	9.7	49.5	0.0
<i>F. catus</i>	38.8	1.0	12.6	47.6	0.0
<i>O. orca</i>	37.7	0.9	17.0	44.3	0.0
<i>L. vexillifer</i>	38.1	1.0	16.2	44.8	0.0
<i>E. caballus</i>	42.1	1.1	15.8	41.1	0.0
<i>C. cristata</i>	38.1	0.0	13.3	48.6	0.0
<i>P. alecto</i>	37.7	0.9	9.4	50.9	0.9
<i>G. variegatus</i>	38.5	1.0	13.5	46.2	1.0
<i>D. novemcinctus</i>	38.5	1.0	8.7	51.9	0.0

Amino acid composition for each sequence was obtained with ProtParam (Expasy) and averaged by amino acid type. Basic, K and R; Acid, D and E; Polar, S, T and N; Hydrophobic, A, G, I, L, M, P, V; Aromatic, F
