

SUPPLEMENTAL MATERIAL

Supplemental Figure and Figure Legend

Suppl. Figure 1: Circulating serum levels of control IgG, HFD IgG and control IgG treated with neuraminidase (NA) decline in a similar manner after administration to B cell-deficient mice. Mice were injected with 150ug of control IgG (A), HFD IgG (B), and NA-treated control IgG (C), and serum levels were monitored daily beginning one day postinjection for 10 days. Values are mean \pm SEM, n=3 per group.
