		Signal over Background		
[NP] (pg/mL)	11+4	11+10	1+4	
10,000	72.8	51.5	66.2	
1,000	8.3	6.0	8.8	
100	1.6	1.3	1.5	

**Figure S-1.** Detection of titrated recombinant NP using best antibody pairs. AlphaLISA counts for **(A)** Pair 1+4, Pair 11+4, Pair 11+10 using 10,000, 1000, 100, and 0 pg/mL of NP. **(B)** Signal over Background (S/B) ratios for best antibody pairs in A. N = duplicate wells. Error bars indicate S.D.

**Figure S-2.** Optimization of best antibody pair and reagent concentrations. AlphaLISA counts for titrated NP using **(A)** 20 µg/mL acceptor and 20 µg/mL or **(B)** 10 µg/mL acceptor and 40 µg/mL Streptavidin for Pair 1+4 and different concentrations of Biotin. Right panel is scaled section of left panel inside of red circle. AlphaLISA counts for titrated NP using **(C)** 20 µg/mL acceptor and 20 µg/mL or **(D)** 10 µg/mL acceptor and 40 µg/mL Streptavidin for Pair 11+4 and different concentrations of Biotin. Right panel is scaled section of left panel inside of red circle. **(E)** S/B ratios for A and B using 1 nM and 2 nM Biotin. **(F)** S/B ratios for A and B using 1 nM and 2 nM Biotin. N = duplicate wells. Error bars indicate S.D.

**Figure S-3.** Standard curves using best conditions for best antibody pairs. **(A)** AlphaLISA signal (counts) for titrated NP (g/mL) from 20,000 pg/mL to 0 pg/mL using ACC/SA = 10-40 µg/mL and 1 nM Biotin-Ab for Pair 1+4. **(B)** AlphaLISA signal (counts) for titrated NP (g/mL) from 20,000 pg/mL to 0 pg/mL using ACC/SA = 10-40 µg/mL and 5 nM Biotin for Pair 11+4. **(C)** S/B ratios for graphs 1+4 and 11+4. N = duplicate wells. Error bars indicate S.D.

**Table S-1** SARS-CoV-2 Nucleocapsid detection in virally infected cell lysates and tissue culture supernatants. **(A)** S/B ratios for Figure 1A. Values in red show the concentrations at which accurate determination of NP is not possible due to the hook effect. **(B)** Interpolated concentrations in ng/mL of NP in TCS and Lysates collected at 24 or 48 hours using the curve from A. **(C)** S/B ratios for Figure 1C. Values in red show the concentrations at which accurate determination of NP is not possible due to the hook effect. **(D)** Interpolated concentrations in ng/mL of NP in TCS and Lysates collected at 24 or 48 hours using the curve from B.

**A**

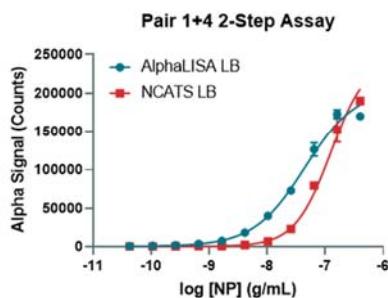

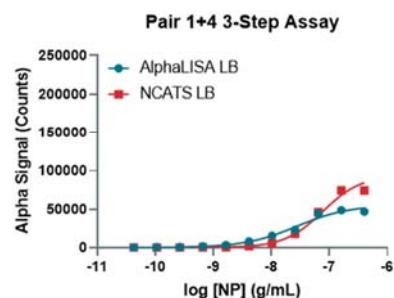

Dispensing protocol (2-step assay):

1. Dispense 5 $\mu$ L of protein
2. Dispense 10 $\mu$ L of mix of acceptor beads and biotinylated antibody  
Incubate 60 min at RT
3. Dispense 5 $\mu$ L of SA-Donor Beads  
Incubate 30 min at RT
4. Read plates on EnVision

**B**

Dispensing protocol (3-step assay):

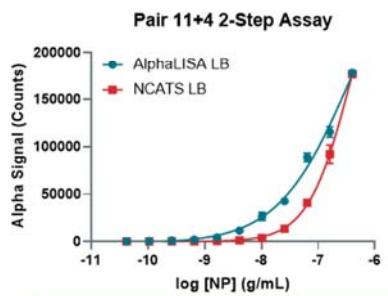

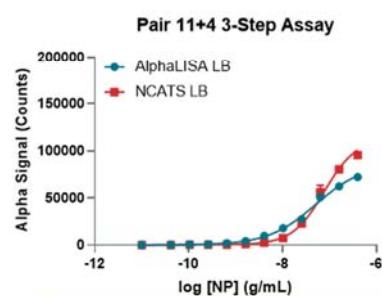

1. Dispense 5 $\mu$ L of protein
2. Dispense 5 $\mu$ L of acceptor beads  
Incubate 60 min at RT
3. Dispense 5 $\mu$ L of biotinylated antibody  
Incubate 60 min at RT
4. Dispense 5 $\mu$ L of SA-Donor Beads  
Incubate 30 min at RT
5. Read plates on EnVision
