

>15% neutralization of the control MLV or substantial cell toxicity/stress at a 1:20 dilution were excluded from analysis (rabbit 2248 B2, rabbit 2246 B3). Neutralization results were not available for the naïve, B1, and B2 samples (indicated by an X).

(C) Neutralization activities against RC1 and 11MUTB pseudoviruses of serum samples from an NHP and a rabbit after an RC1-4fill-VLP prime are shown. Both animals exhibited stronger neutralizing antibody responses to RC1 than to 11MUTB.
