Supplementary Note 1. Pupil / iris pupil segmentation model.

A deep learning model was trained for pupil / iris pupil segmentation because most existing methods were developed to detect either the pupil or iris, and not for these magnified images with circular cutouts. The iris and pupils were each modeled as axis-aligned ellipses with 4 parameters each: x / y center coordinates and x / y dimensions. All 8 parameters were represented as floating point numbers in the range [0,1], representing the fraction of the image width or height. A deep learning model was trained using a L2 regression loss to take as input the external eye image and output these 8 parameters. The architecture was otherwise identical to the disease prediction models. This model's hyperparameters are detailed in Supplementary Table 14, and results are presented in Supplementary Figure 6.

Supplementary Table 1 | Area under receiver operating characteristics curve (AUC) of our models for the four validation sets.

(A) validation set A, (B) validation set B, (C) validation set C, and (D) Validation set D. Bold indicates $p < 0.05$. †:prespecified primary prediction tasks.

*Because two eyes of the same patient can have different cataract statuses and pupil sizes, for this analysis we selected a random eye that fit this criteria per patient. In other words, in contrast to other analysis in this paper, these HbA1c predictions are from a single eye instead of being the average of two eyes.

Supplementary Table 7 | Subgroup analysis for Tg ≥ 200 in validation set A.

Note that the sum of some subgroups can exceed the total because some patients have multiple visits over time that can fall under different groups. Bold indicates there is a >5% decrease in AUC for the DLS in that subgroup compared to the entire cohort.

Supplementary Table 14 | Hyperparameters.

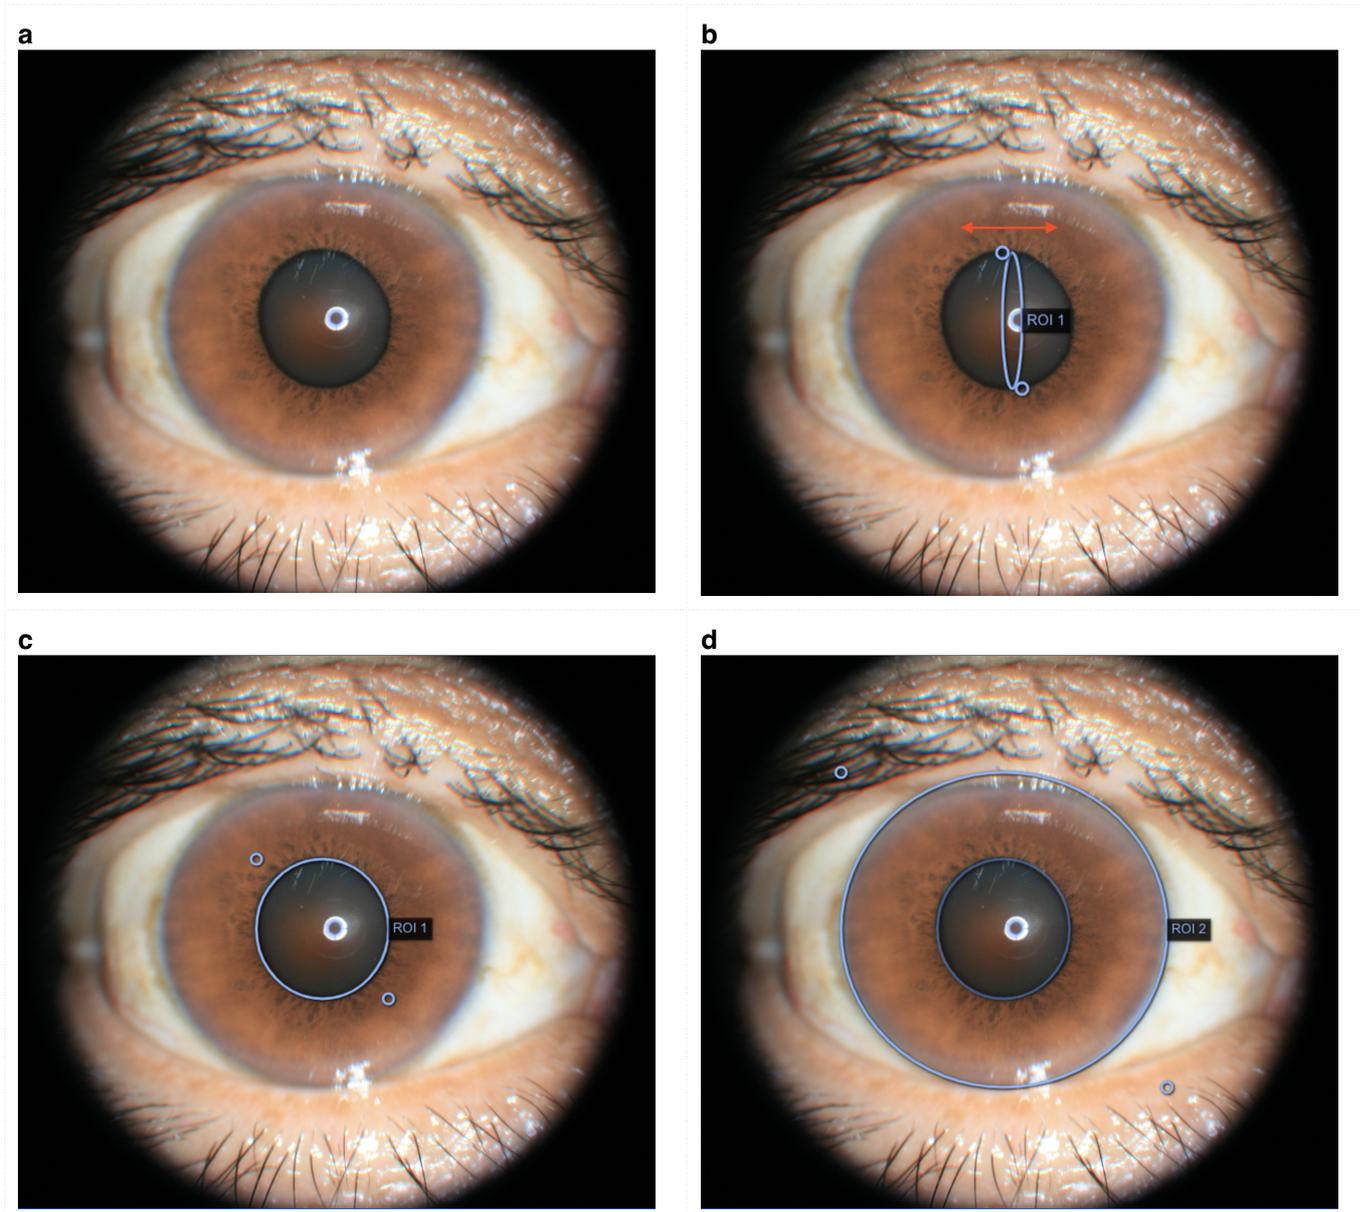

(A) common across models and (B) specific to each selected model.

A

Hyperparameter	DLS (external eye image)	Pupil / iris model
Batch size per TPU core	8	8
Number of TPU cores	8	2
Effective batch size	64	16
Moving average decay rate	0.9999	0.9999
Max training steps	300000	300000
Input image size [pixels]	587 × 587	587 × 587
Random flip	Horizontal and vertical	-
Random brightness max delta	0.1148	0.1148
Random hue max delta	0.0251	0.0251
Random saturation range	0.5597 - 1.2749	0.5597 - 1.2749
Random contrast range	0.9997 - 1.7705	0.9997 - 1.7705
Random scale factors	1.0X (60%), 1.3X (20%), 1.5X (20%)	1.0X (100%)
Dropout rate at final layer	0.2	0.2
Weight decay rate (L2 regularization)	4.0e-05	4.0e-05
Model architecture	Inception V3	Inception V3
Preinitialization	ImageNet	ImageNet

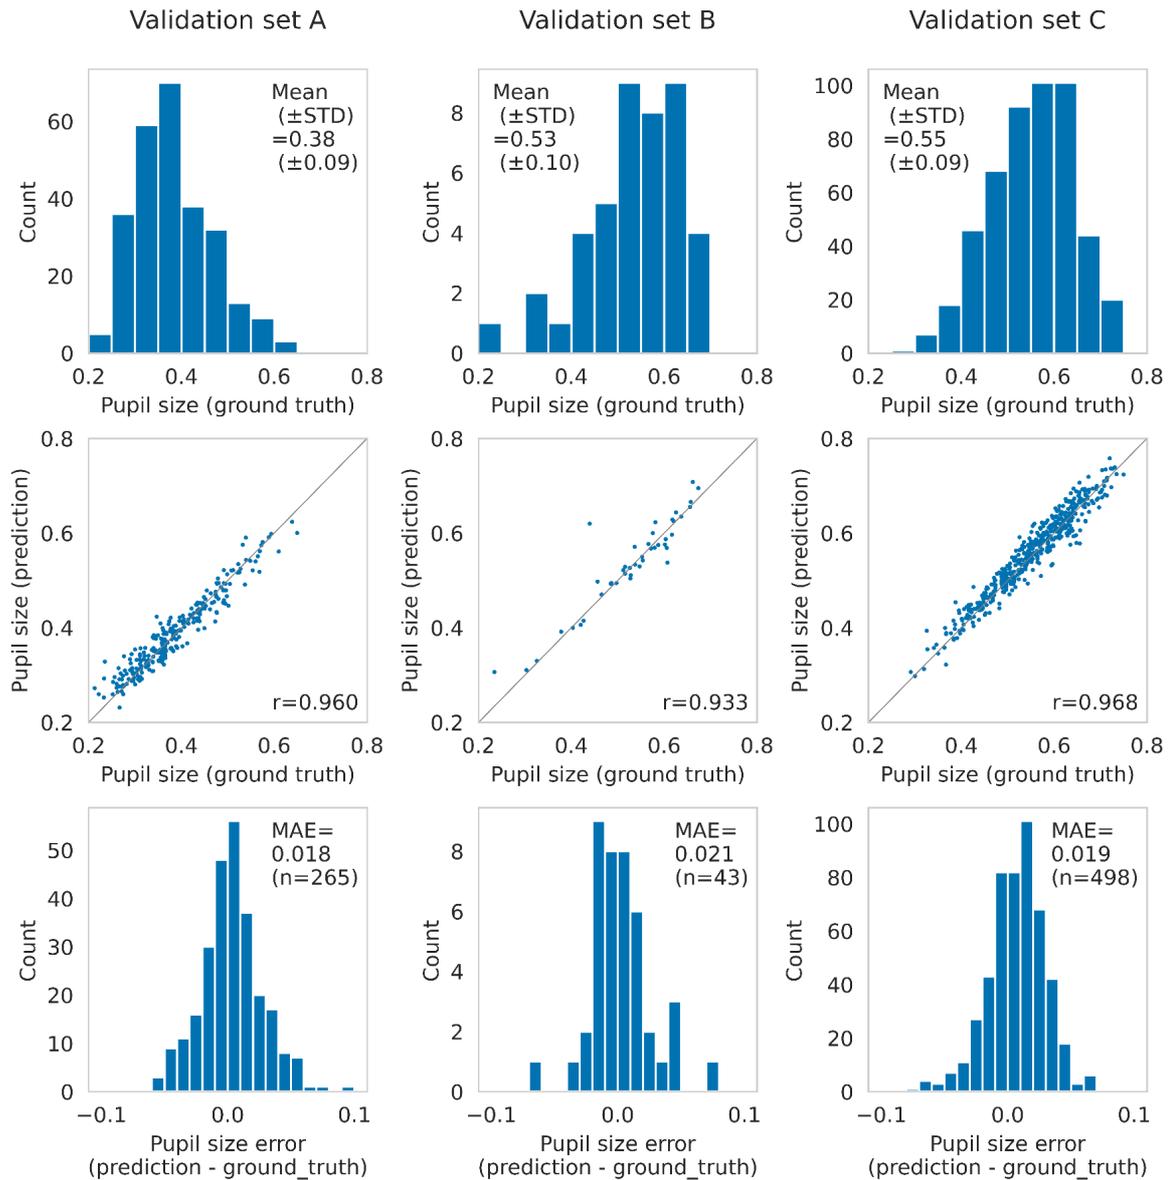

B

Hyperparameter	DLS 1	DLS 2	DLS 3	DLS 4	DLS 5	Pupil / iris model
Optimizer	Momentum	Momentum	Momentum	Momentum	Momentum	Momentum
Initial learning rate	1.39e-02	2.53e-02	2.17e-02	3.58e-03	1.38e-02	4.57e-02
Decay steps	10000	20000	10000	50000	50000	50000
Decay rate	0.662	0.545	0.610	0.956	0.685	0.725
Pre warm-up learning rate	1.39e-03	2.53e-03	2.17e-03	3.58e-04	1.38e-03	1.39e-03
Warm up steps	4000	4000	4000	4000	4000	4000
Training steps (early stopping)	52000	90000	78000	80000	136000	298000

Supplementary Figure 1. Pupil / iris segmentation tool.

The segmentation tool involved drawing ellipses using a custom click and drag interface (A-C), to produce two ellipses: one around the pupil and another around the iris (D).

Supplementary Figure 2. Accuracy of pupil size predictions by pupil/iris segmentation model.

Pupil size is represented as a fraction: the pupil radius divided by the iris radius. (Top row) Distribution of ground truth pupil size in each dataset. Note that validation set A contained non-dilated pupils, whereas pupils in validation sets B and C were dilated. (Middle row) Joint distribution of ground truth and predicted pupil size. Text indicates Pearson's correlation coefficient (r). (Bottom row) Distribution of errors (difference between predicted and ground truth pupil size). Abbreviations: STD = standard deviation, MAE = mean absolute error.
