

Supplementary Figure 3. C4-HSL activation of human TAS2R38 is statistically significant when compared to the human TAS2R43 response. Each point represents the average of 4 replicate measurements. For each time point the 4 baseline-corrected values for TAS2R38 and TAS2R43 were compared by unpaired, two tailed t-test. Significant differences are indicated by bars, with indicated P values (* < 0.05, ** < 0.01, *** < 0.001).
